Automatic inspection of simulation results

By automatically inspecting the simulation results,
the workload of the engineers is reduced, and quality is improved.

Development

▶ Engine for inspection of the simulation results (Operations log)

▶ Function to download model information set in the simulator

▶ Function for definition of conditions to determine working

▶ Inspection result display function

Features

▶ Since inspection is linked to the running of the simulator and happens automatically, uniform quality can be ensured even during development

▶ Since the definition of conditions to determine working can be specified relative to the operations log

▶ ("Use a certain result to check for the presence or absence of another result", etc.), determination standards can be specified considering the working status of the system

▶ Since model information (settings file) can be used for definition of conditions to determine working, the determination standards can easily be maintained
